ORIGINAL ARTICLE

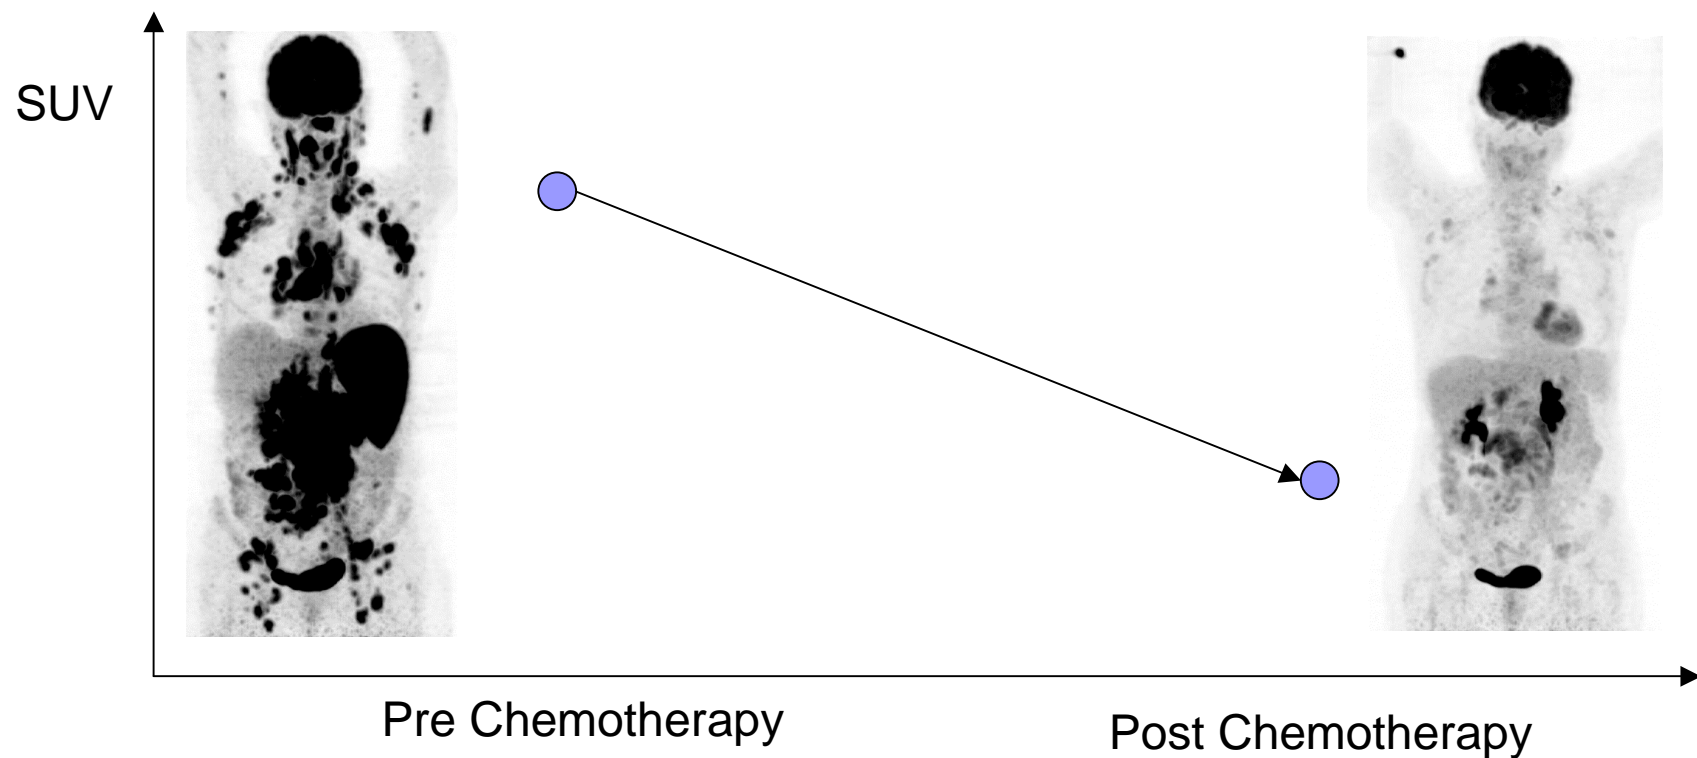

Does chemotherapy influence the quantification of SUV when contrast-enhanced CT is used in PET/CT in lymphoma?

Objectives

- For lymphoma
 - Impact contrast enhanced CT for attenuation correction in PET-CT
 - Influence of chemotherapy on SUV variations

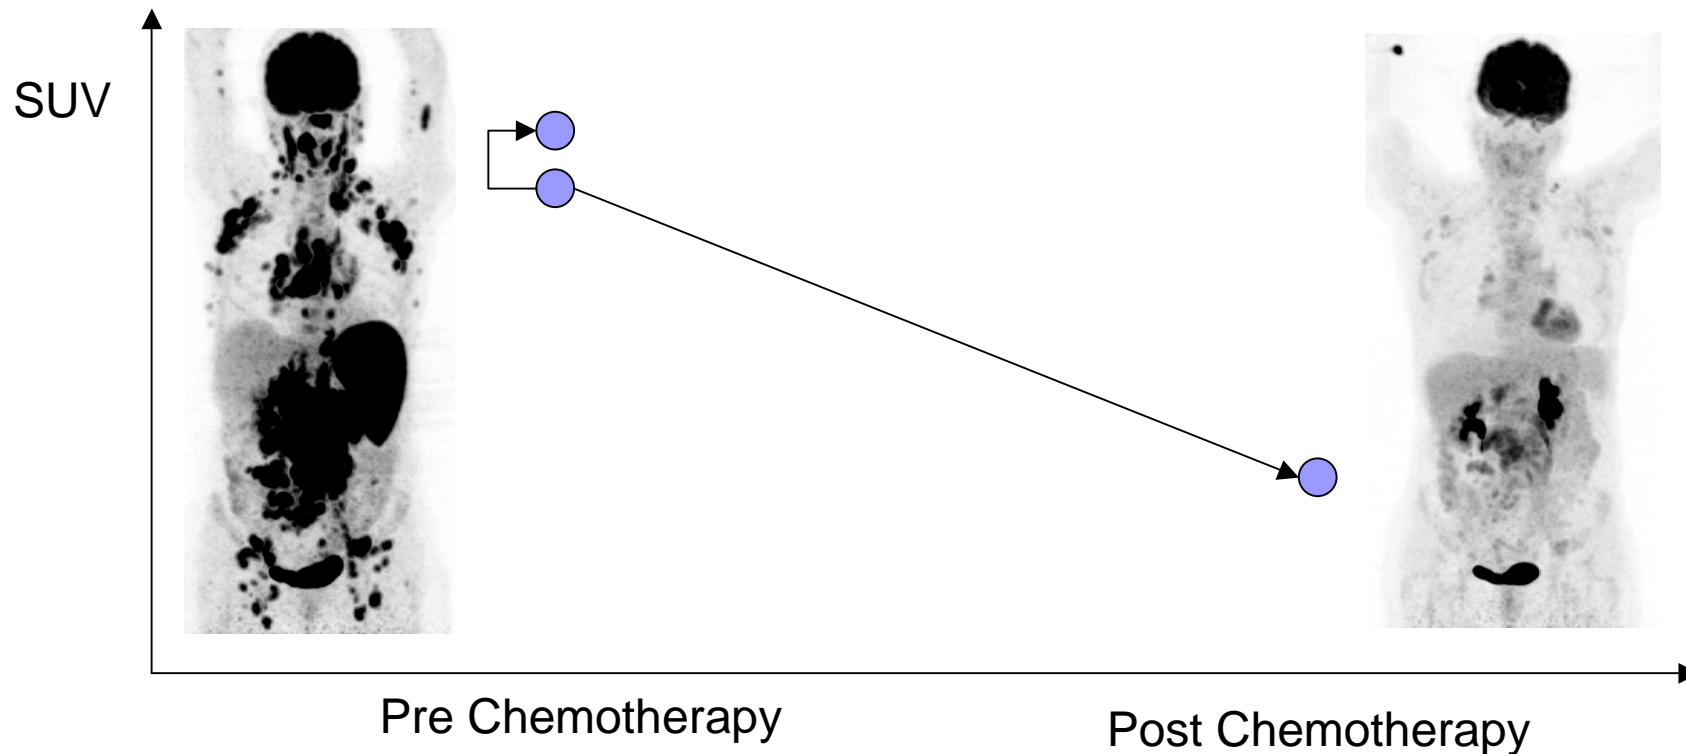

Objectives

- For lymphoma
 - Impact contrast enhanced CT
 - Influence of chemotherapy on

Antoch AJR 2002	SUV _{mean}	30 pts vs 10 control 120 ROIs vs 40 ROIs	No significant ROI	<u>p not significant</u> 1 intrahep 3 perihep
Yau J Nucl Med 2005	SUV _{max}	26 pts 193 ROIs	Liver : 5.8% Spleen : 4.8% Aorta : 6.6% Lesions : 3.8%	<u>p not significant</u> Lung Femur Ilio-psoas
Mawlawi AJR 2006	SUV _{max}	9 pts 48 ROIs	SCV : 27.1% Heart : 16.7% Lesions : 8.4%	<u>p not significant</u> Liver Spleen
Berthelsen Eur J Nud Med 2005	SUV _{mean}	19 pts 49 ROIs	Liver : 5.8% Lesions : 3.6% Global : 2.3%	<u>p not significant</u> SCV

Small series, various parameters, inconstant results,
no studies on the effect of treatment

Design

- Prospective Study
- Protocol before (t_0) and after chemotherapy (t_1)
 - 3 ± 1 cures [2 – 6]
- **50 patients** [31 ♂ (62%)] with lymphoma (**100 PET**)
 - Age 51 ± 18 y/o
 - 33 (66%) NHL et 17 (34%) HD
- PET-CT : Biograph Sensation 16

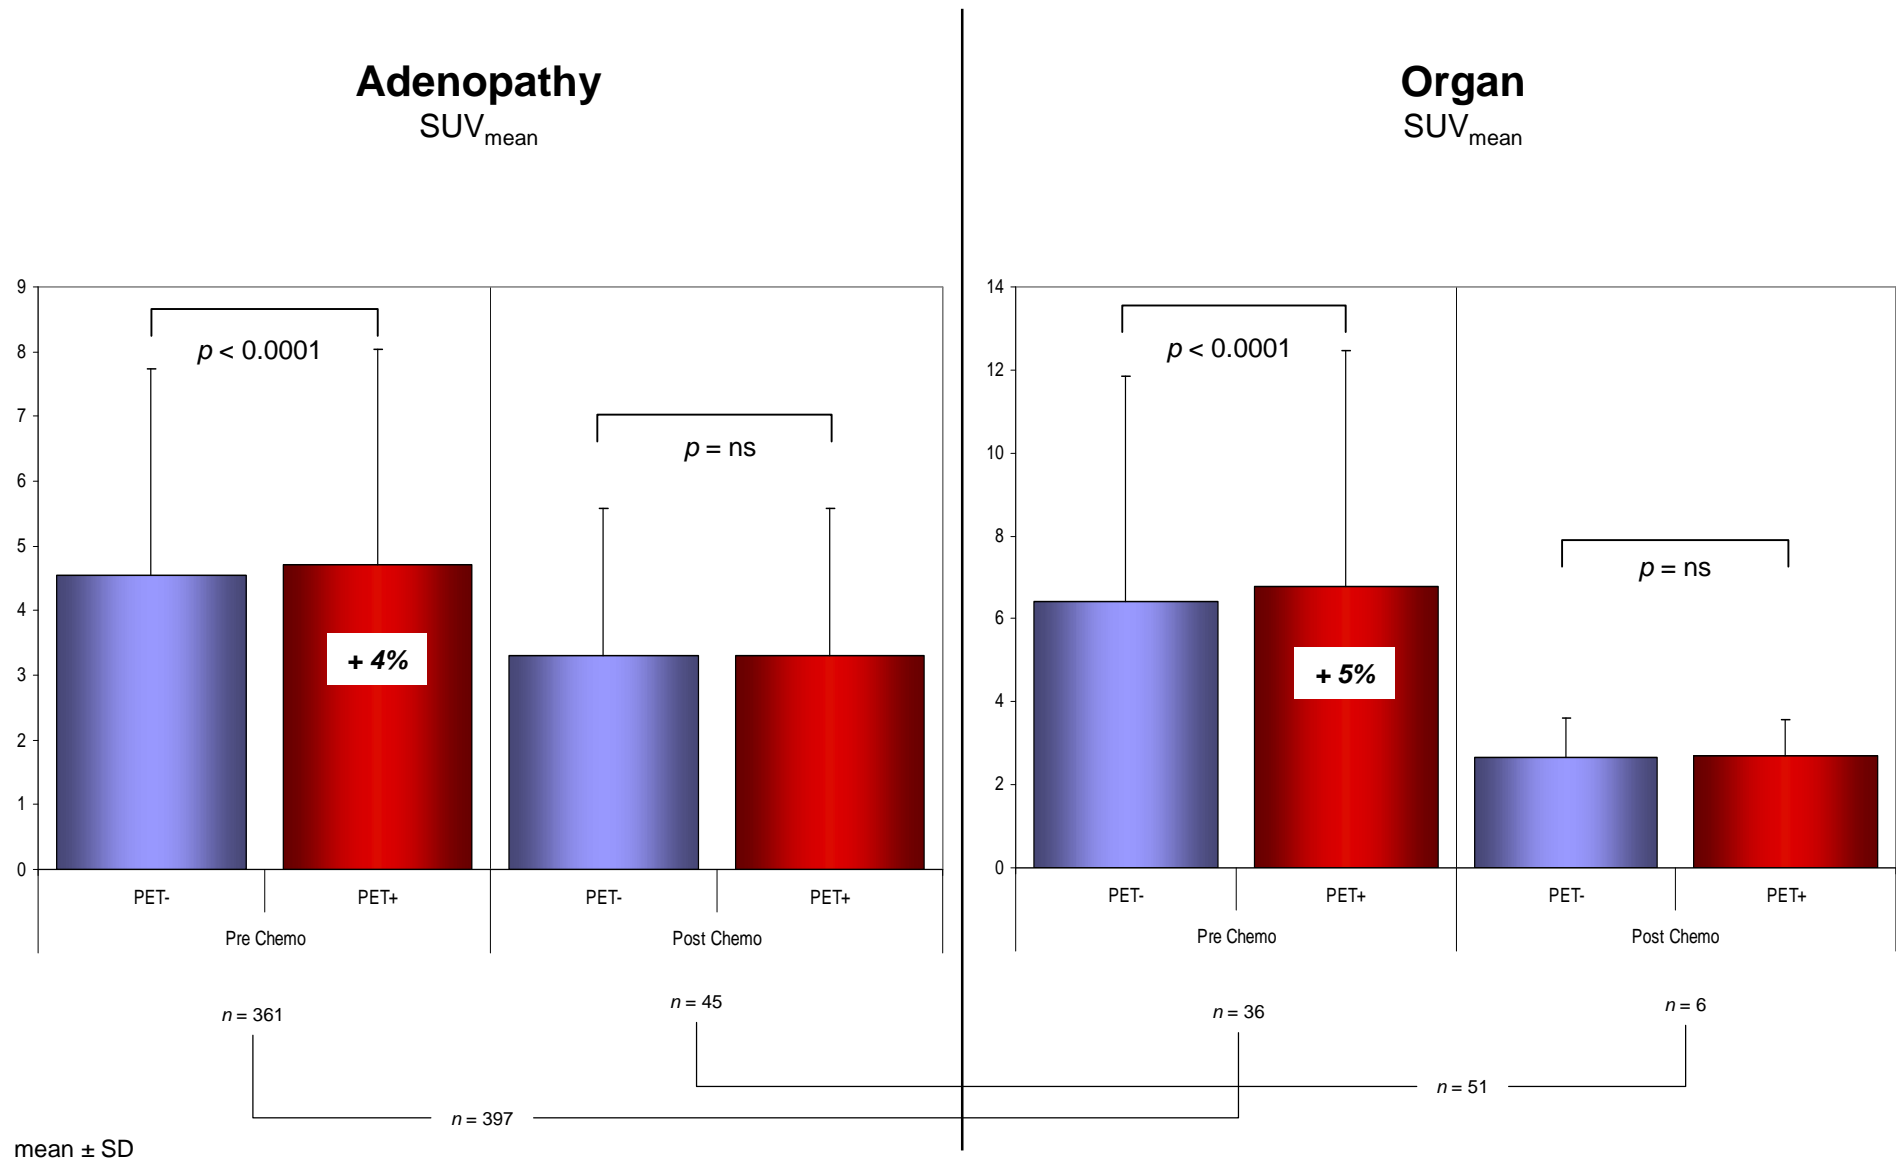

SUV_{mean} & SUV_{max} in lesions

$p = 0.0014$

mean \pm SD

SUV : Adenopathy vs organ

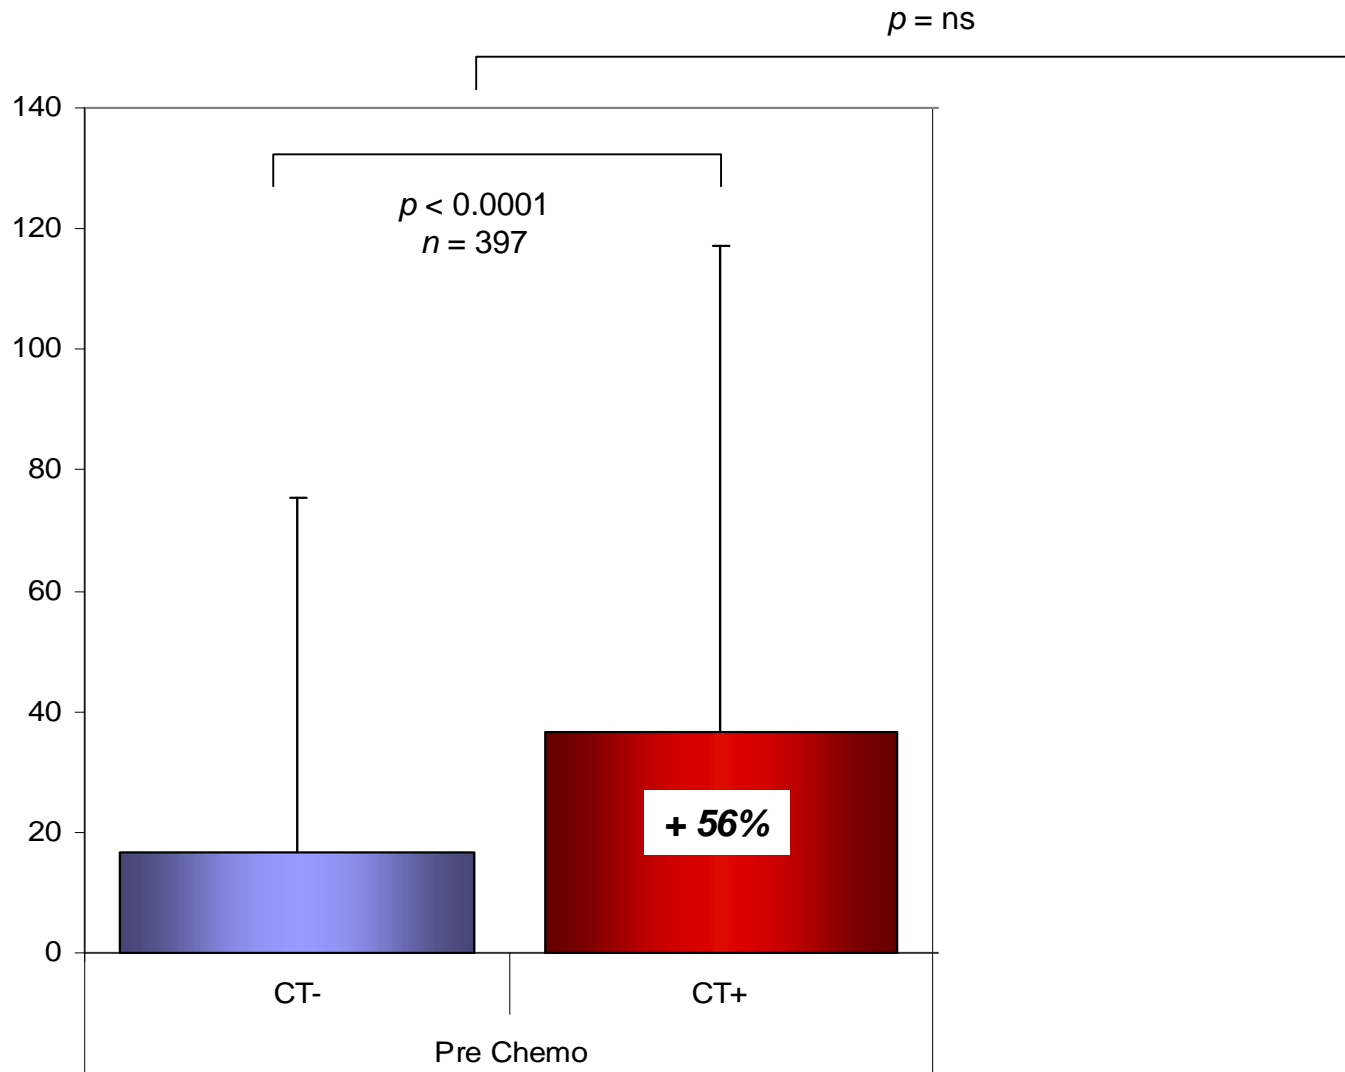

SUV_{mean} on non tumoral tissues ($n=100$)

mean ± SD

HU_{mean} in adenopathy and organs

mean \pm SD

PET-

PET+

Two vascular artifacts

PET-

PET+

Comfort interpreting CT

Conclusion

- PET-CT+ feasible for **lymphoma**
 - Before and after chemotherapy with negligible impact on quantification
 - **+4%** SUV_{mean} and SUV_{max} before chemo (< variability of the SUV)
- Artifacts : easily found
- Comfort interpreting CT (la Fougere, 2008)
- Only one examination : PET/CT+
 - For staging and for evaluation at mid-treatment
